Why a Minority Joint Venture Interest Matters

- There are many past examples of minority interests in major discoveries yielding outsized returns for investors
 - Ridgeline's earn-in deals with NGM and South32 have the potential for similar trajectories if a discovery is made

FLAGSHIP PROJECT

Big Blue

50 km² Land Package

Porphyry & CRD

Cu-Au-Ag ± Pb-Zn

100% OWNED

50km² land package covers past producing Delker and Skarn Hill Mines and is located directly adjacent to Reyna Silvers Medicine Springs CRD project

HIGH-GRADE

Delker Mine produced 94,434 pounds Cu @ 6.2% average grade (1916-1917⁽¹⁴⁾)

- Delker Trench: **0.6m @ 15.5% Cu within 2.4m @ 4.6% Cu**
- Skarn Hill Rock Chips: **6.44% Cu, 0.16 g/t Au, 53.75 g/t Ag**

THE OPPORTUNITY

Potential to discover porphyry/skarn Cu-Au and CRD type Ag-Pb-Zn deposits

- (deposit analogues include Butte Valley Porphyry, Robinson Cu Mine, Selena Project)

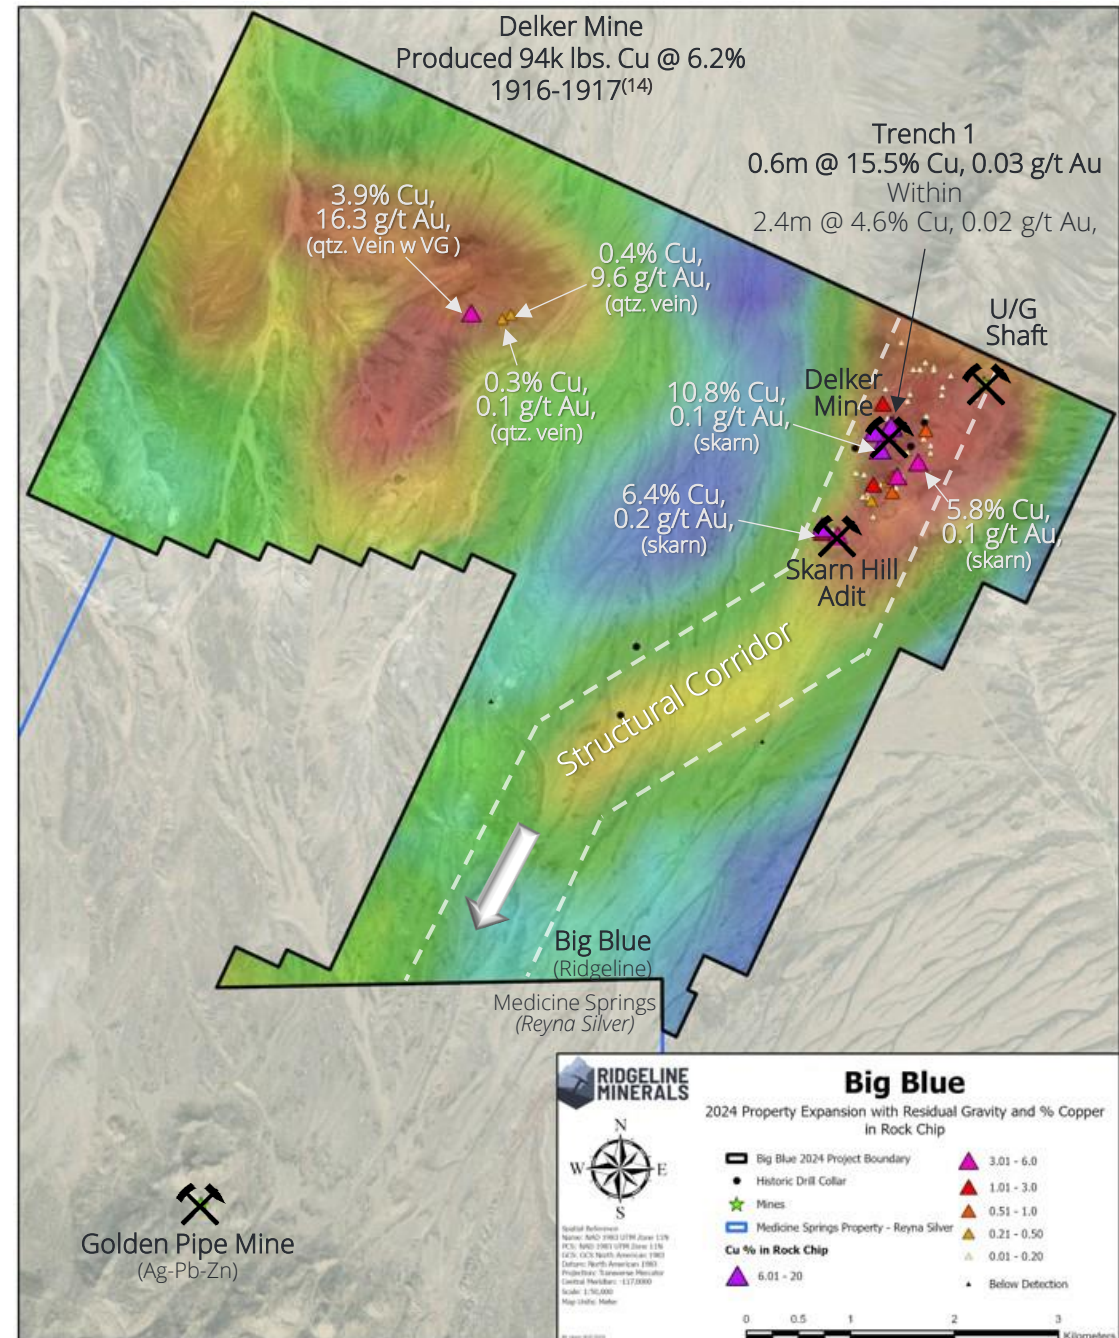

2024 OBJECTIVE

- Q3 – Geophysical survey (IP) identified multiple porphyry targets
- Q4 - Infill IP lines over Delker Target

BIG BLUE

Historic Cu District

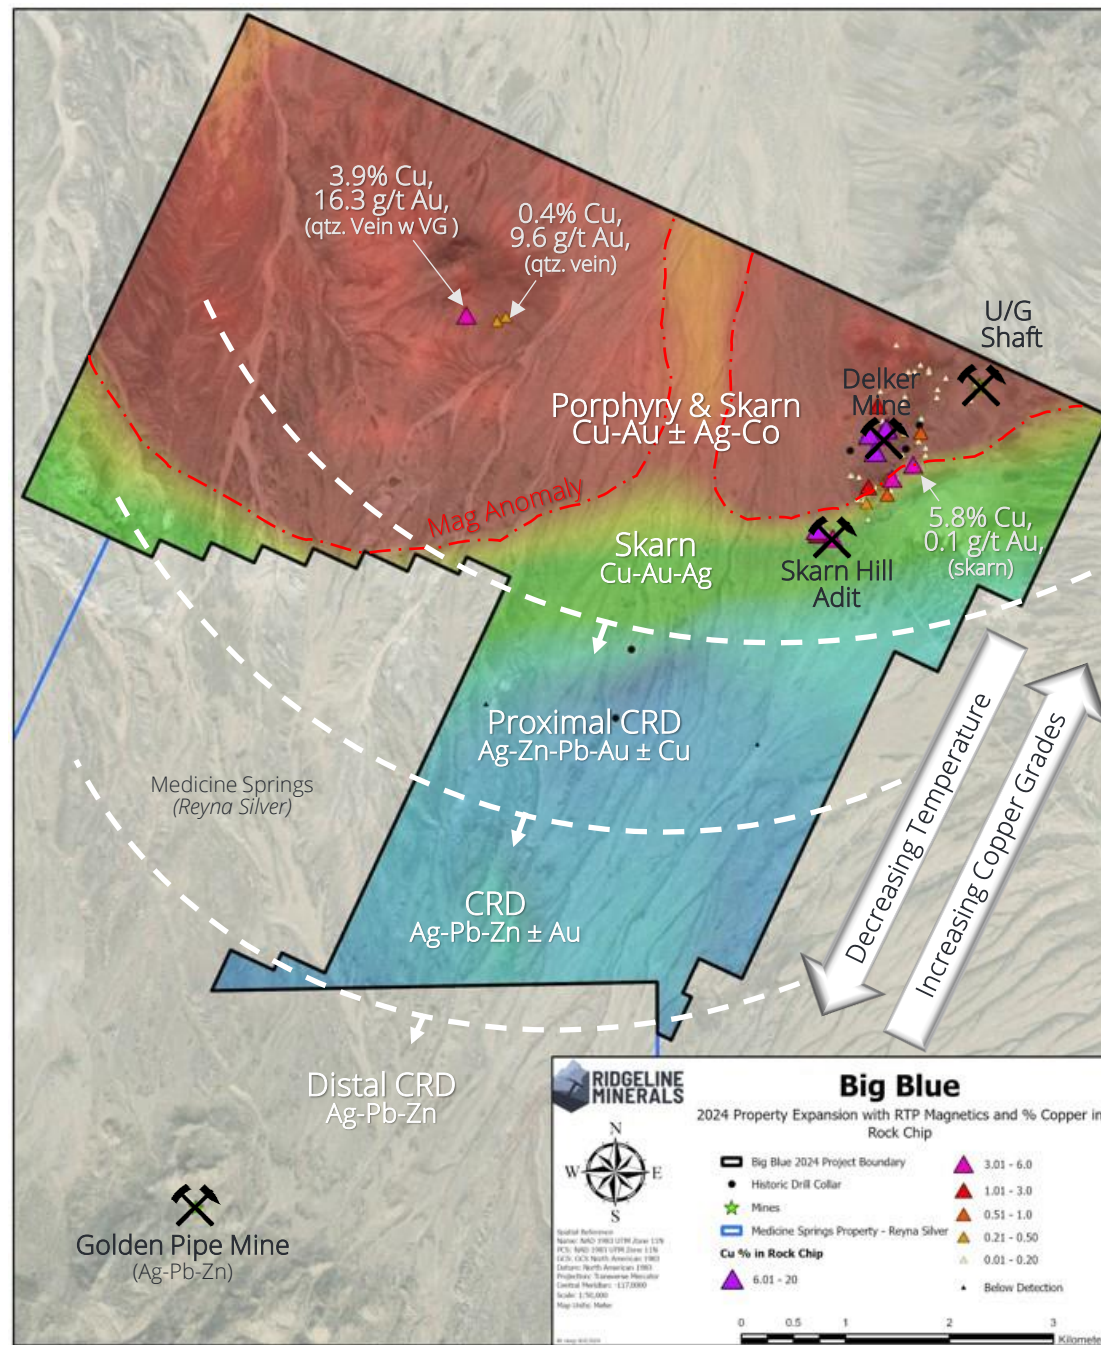

- The Big Blue Project includes the past producing Delker Mine, which produced 94,434 pounds of copper at an average grade of 6.2% Cu between 1916-1917⁽¹⁴⁾
 - Ridgeline Trench #1 confirmed grades at Delker with up to 0.6m @ 15.5% Cu
- Porphyry-Skarn Cu and CRD targets have not been adequately tested at depth or along strike towards Medicine Springs
- Proposed northeast structural corridor connects with Reyna Silver's Medicine Springs Ag-Pb-Zn Carbonate Replacement ("CRD") project

BIG BLUE

Porphyry Zonation

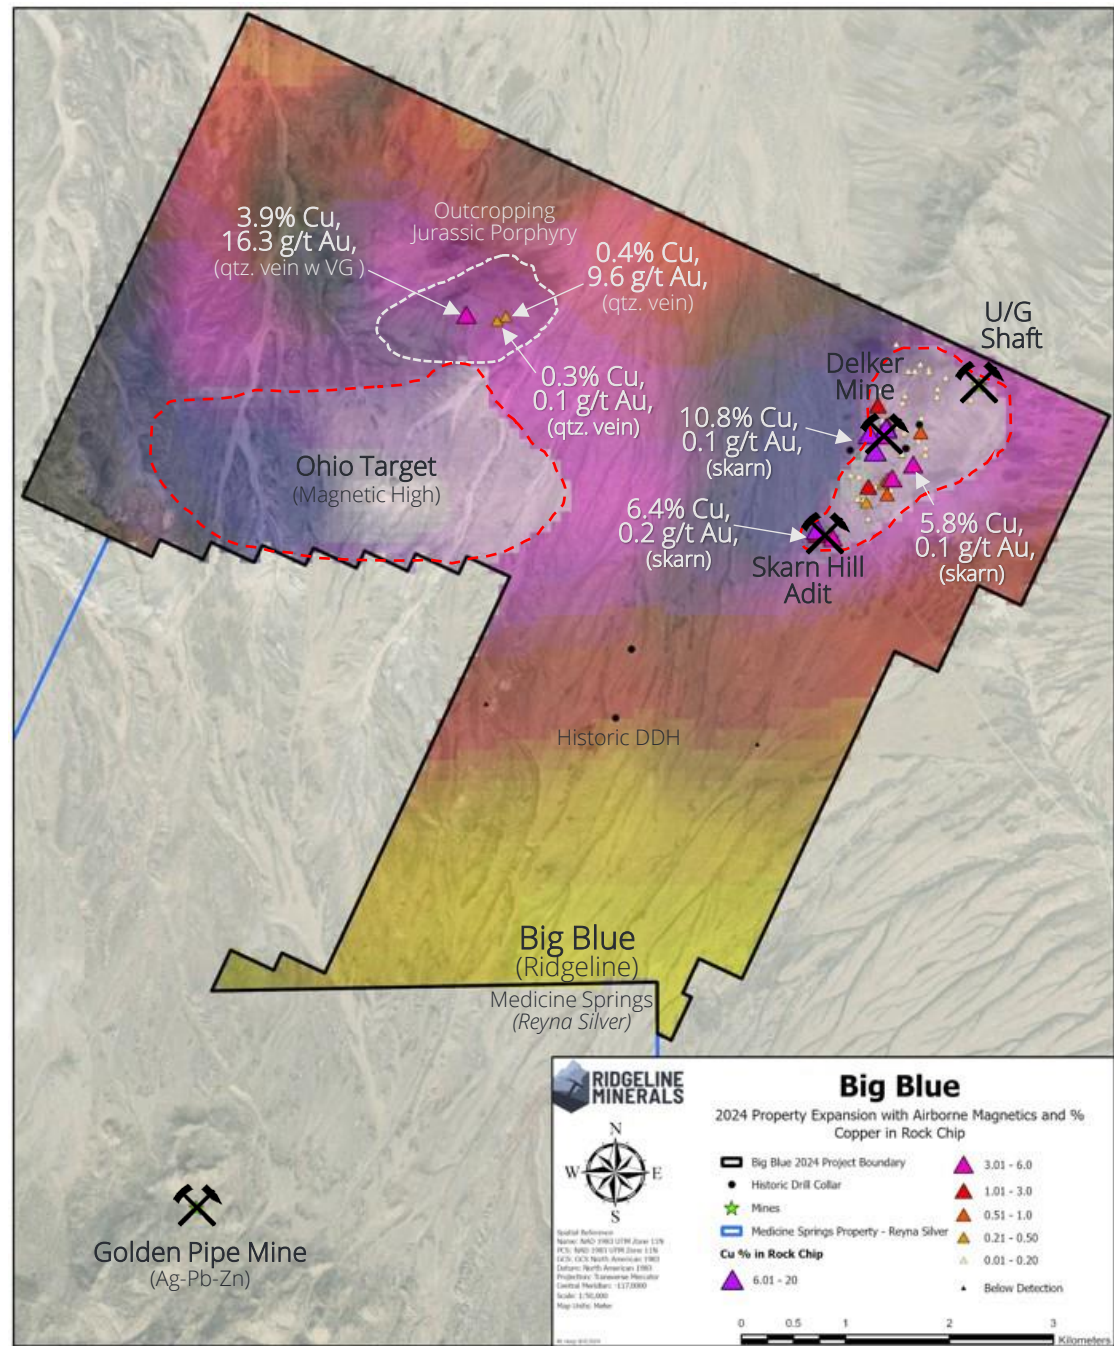

- Porphyry's exhibit systematic zonation patterns that transition from higher-temp porphyry-skarn (Cu-Au-Ag) mineralization to lower temperature CRD (Ag-Pb-Zn) over multiple kilometers of strike
- Proposed porphyry Cu target at Big Blue interpreted source to:
 - Proximal Cu Skarn at the Delker Mine
 - Distal CRD at the Golden Pipe mine (Reyna Silver)
- Big Blue exhibits 6km of untested strike with potential for discovery of the full porphyry-CRD spectrum

BIG BLUE

Two Porphyry Centers

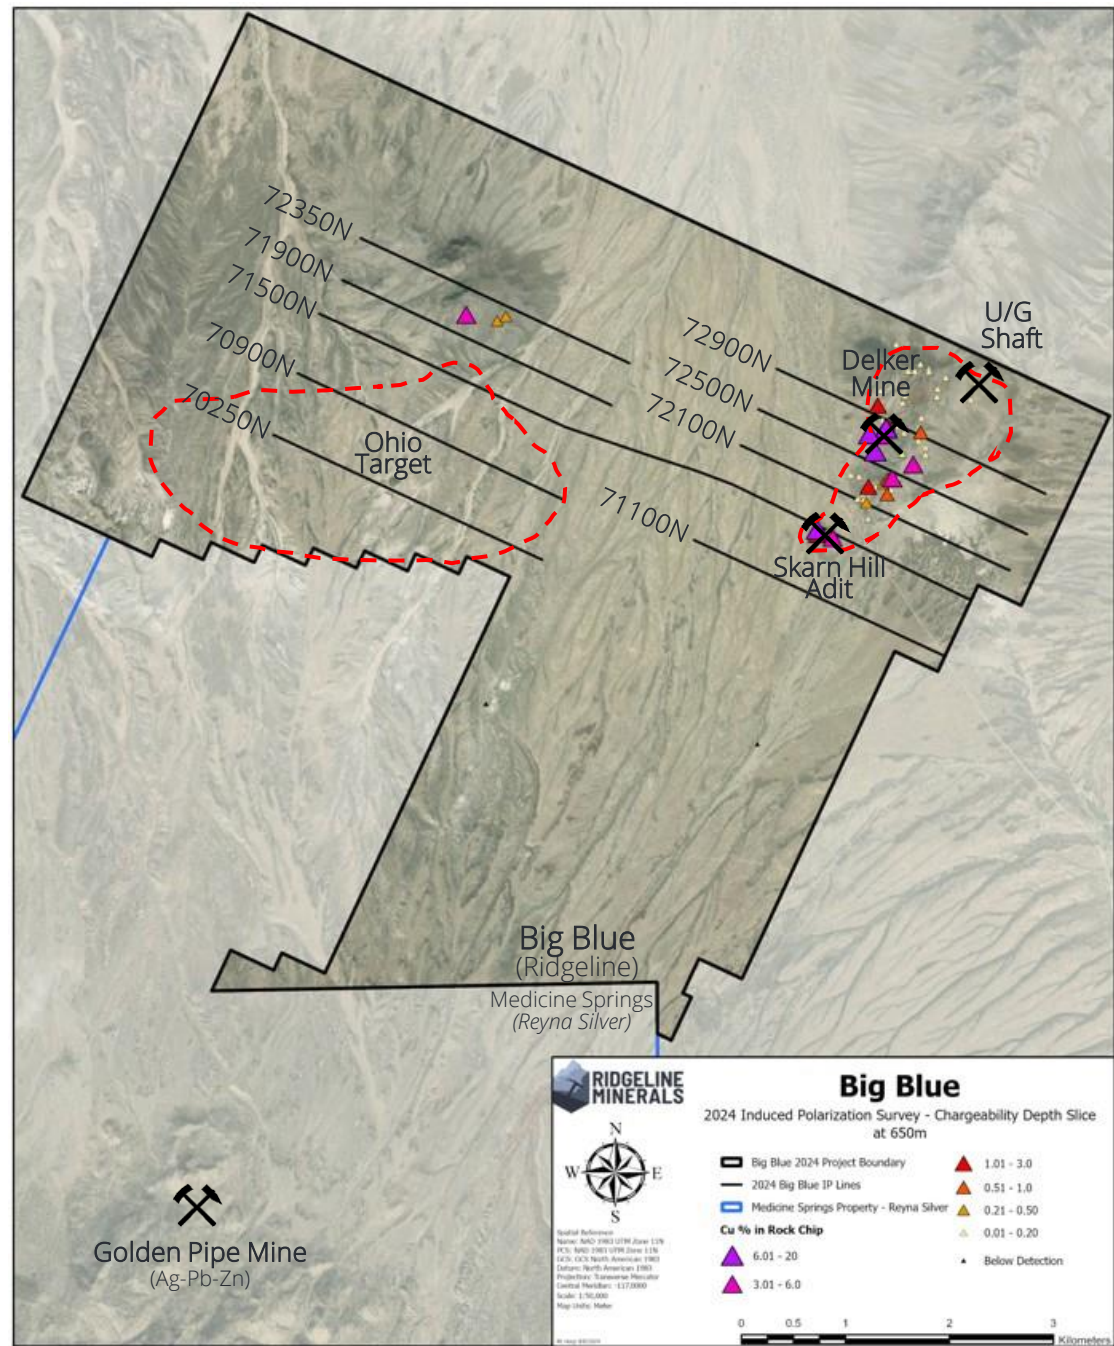

- Airborne magnetics data supports the potential for two porphyry centers at Big Blue
 - Larger of the two magnetic highs (Ohio Target) is buried under alluvial cover
- Outcropping Jurassic porphyry located directly to the north (white dash) of the buried mag high does not show a similar magnetic signature
- Similar tenor of magnetic response as the Delker Mine area suggests the two mag highs are related and a different age than the older Jurassic porphyry's across the district

BIG BLUE

2024 IP Survey Lines

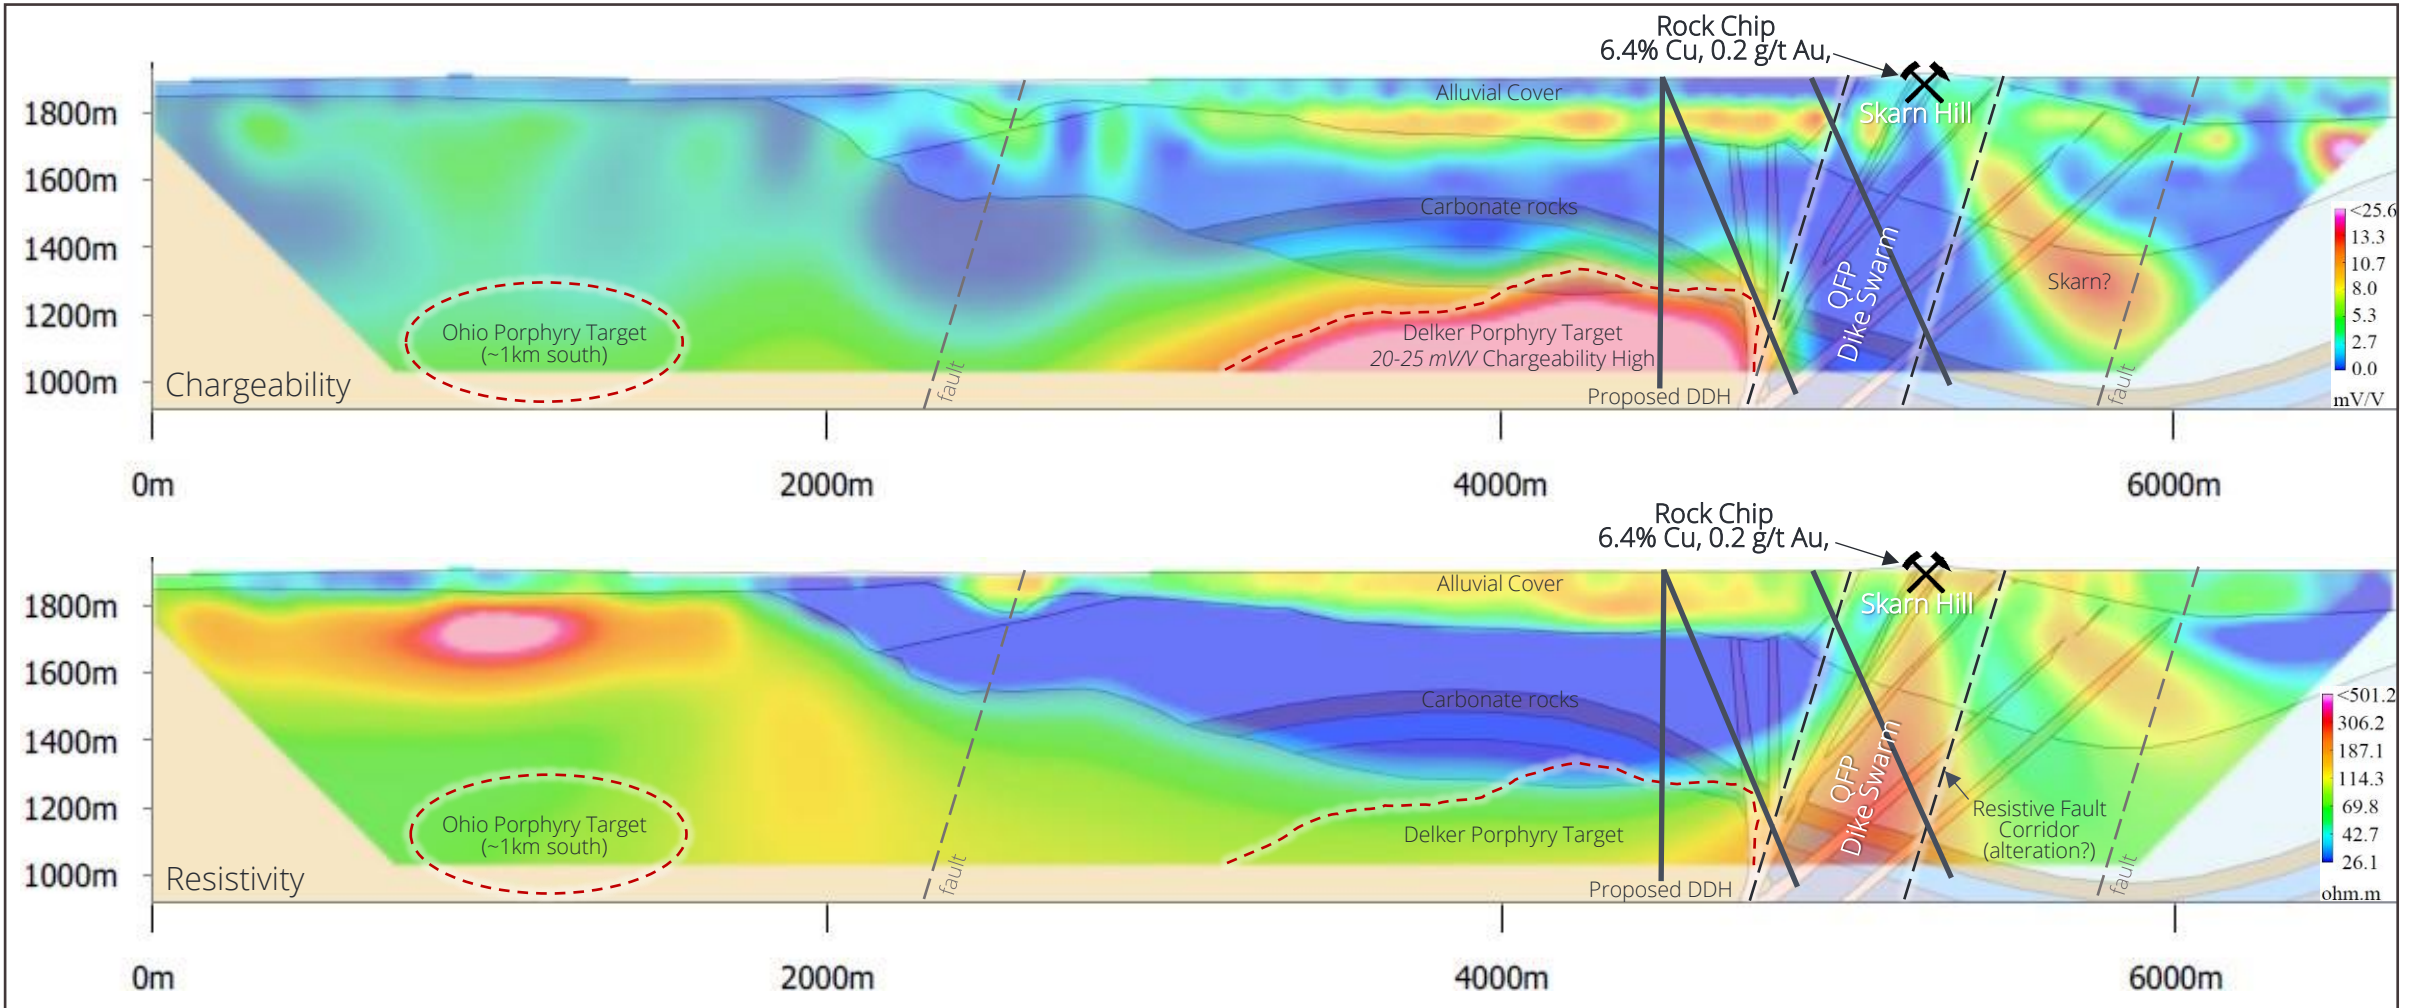

- IP survey was designed as a first-pass survey over both the Delker and Ohio porphyry targets
 - Additional lines planned to connect targets across the basin and increase survey resolution prior to initiating maiden drill program in Q1 2025

DELKER TARGET

IP Line 71500N X-Sections

- Strong chargeability anomaly (25 mV/V = ~5x background) down-dip of the historical Skarn Hill Adit supports Ridgeline's interpretation that there is a blind porphyry target feeding the Delker Mine trend (2+ km of strike)

BIG BLUE

Delker Porphyry Target – Cu Skarn

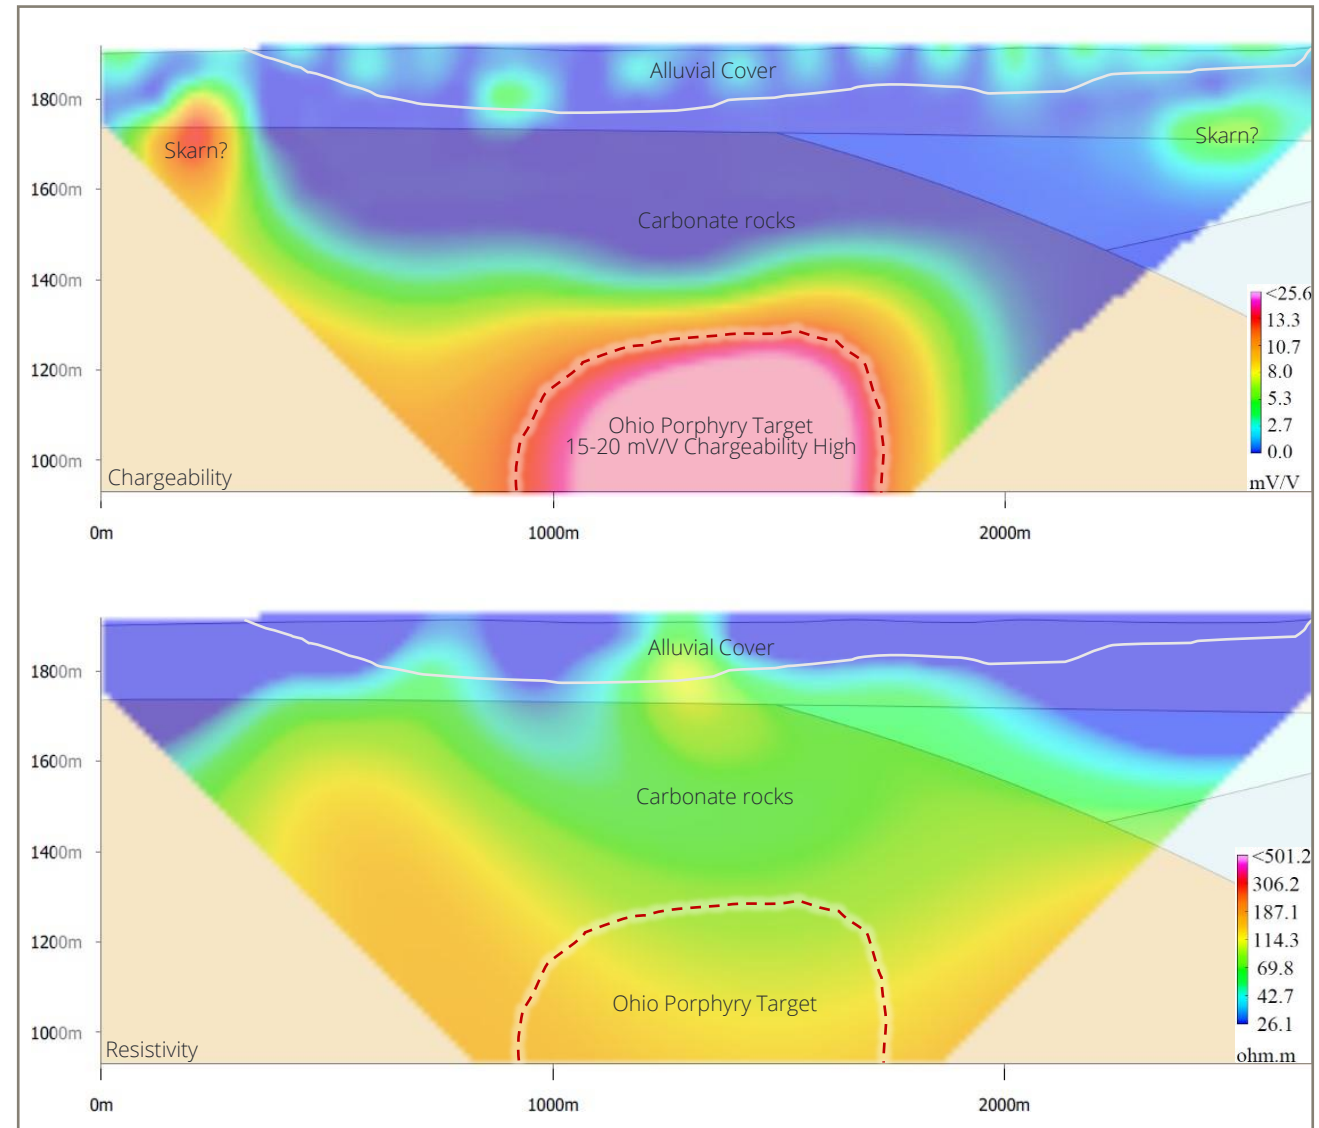

- Mining at the Delker Mine targeted enriched oxide Cu skarn within 5 meters of the surface
- Historical operators did not explore at depth to target the potential porphyry Cu-Au source

OHIO TARGET

IP Line 70250N X-Section

- Strong chargeability high (15-20 mV/V) that is ~800m wide to the E-W at the Ohio target exhibits a coincident magnetic anomaly (slide #30) that suggests potential for a deeper porphyry source
 - Ohio chargeability anomaly is interpreted as either a faulted off portion of the Delker porphyry or a standalone porphyry center (potential cluster)
 - High-grade Cu-Au samples <1km north of Ohio target returned up to **16.3 g/t Au** and **3.9% Cu** with visible gold in qtz. veins
- Resistivity results are low resolution but do show a widespread, weak-moderate resistive anomaly at depth

BIG BLUE

Ohio Porphyry Target – VG

- Team has identified Visible Gold (VG) with strong copper oxides within quartz veins at the Ohio Target
- Quartz veins occur as northwest trending discrete and stockwork vein sets that crosscut the outcropping Jurassic age granodiorite
 - Mineralized quartz veining interpreted as an upper-level expression of the proposed Ohio porphyry target at depth
 - The outcropping granodiorite represents the only surface exposure in the Ohio Target area with the proposed porphyry target located ~1km south and under alluvial cover
